Introduction
Quiz, 5 questions

5/5 points (100%)

✓ **Congratulations! You passed!**

Next Item

✓ 1 / 1
point

1.

A computer program is said to learn from experience E with

respect to some task T and some performance measure P if its

performance on T, as measured by P, improves with experience E.

Suppose we feed a learning algorithm a lot of historical weather

data, and have it learn to predict weather. What would be a

reasonable choice for P?

✓ 1 / 1
point

2.

Suppose you are working on weather prediction, and your weather

station makes one of three predictions for each day's weather:

Sunny, Cloudy or Rainy. You'd like to use a learning algorithm

to predict tomorrow's weather.

Would you treat this as a classification or a regression problem?

✓ 1 / 1
point

3.

Introduction

Quiz, 5 questions

5/5 points (100%)

Suppose you are working on stock market prediction, Typically tens of millions of shares of Microsoft stock are traded

(i.e., bought/sold) each day. You would like to predict the

number of Microsoft shares that will be traded tomorrow.

Would you treat this as a classification or a regression problem?

✔ 1 / 1 point

4.

Some of the problems below are best addressed using a supervised learning algorithm, and the others with an unsupervised learning algorithm. Which of the following would you apply supervised learning to? (Select all that apply.) In each case, assume some appropriate dataset is available for your algorithm to learn from.

✔ 1 / 1 point

5.

Which of these is a reasonable definition of machine learning?
